

## **Facility description/health monitoring IMP IMBA 3. UG Animal House**

This facility was set up in October 2007 for the first time and only mice are housed here. The facility in the 3. UG comprises 25 animal rooms (No. 1 - 25) and is run as fullbarrier animal husbandry. There is no strict barrier between the single rooms within this area protected by the barrier. This means the health status, which is valid for one single room is valid for all other rooms, if one room shows a positive result for a specific pathogen all other rooms have to be considered as positive for this pathogen too. Rooms are used as multipurpose units, there are many different types of experiments, there is frequent introduction of animals (> 16 per month) from different breeding units (from one or several breeders), there is frequent entry of research personnel in addition to animal care staff and there is frequent change of personnel working in the unit, there is introduction of biological materials (e.g. sera, tumours, tissues, (ES) cells) originating from the same animal species that are housed in the unit, there are no infected animals on the site. Currently not all rooms are used for housing mice (empty rooms, laboratory areas). The whole area behind the barrier is provided with HEPA filtered air (15 x airexchange rate per hour). Every single animal room has 2 different entrances: one for the service area and one for the user area. Animal house staff and animal house users enter the barrier from separate sluice-sites. Air pressure regulation makes sure that there is no air exchange between the different animal rooms.

The mice are given an autoclaved standard pelleted breeding diet (SSNIFF) and autoclaved water, which is acidified by sulfuric acid (ph 2.5-3.0) additionally. About 200 persons (animal technicians, scientists) are authorised to work in the mouse facility.

Personnel on entering the facility have to put on the following: disposable clothing, gloves, labshoes and overshoes, hats, masks. Before entering and leaving the husbandry an airshower (HEPA filtered air, 60 sec.) has to be passed.

The health monitoring is based on results obtained from the investigation of soiled bedding sentinels. New sentinels (e.g. Swiss Webster) delivered by a commercial breeder (e.g. Charles River) with standardised and confirmed health-status are introduced into the rooms about every 21 weeks. Health screening comprises sera checks after 21 weeks (no parasitology, no necropsy) of about 70 % of the animals and an additional whole animal investigation of the remaining mice according to FELASA recommendations (52 m), which is carried out about 12 weeks later.

When assessing the health status of the mice in question please consider that results obtained from soiled bedding sentinels housed in individually ventilated cages might be diagnostically less conclusive. Since sentinels mirror the health status of mouse colonies on the day of investigation, they cannot be taken as guarantee of the present or future health-status. The high number of persons working in the animal house has to be considered as risk for the health status of our mouse-colonies.

The mice in question were born and bred at IMP / IMBA animal facilities Vienna according to European laboratory animal law and they are to be used solely for scientific experiments, they have not originated from a facility, where work with foot and mouth virus or exotic disease agents affecting livestock or poultry is conducted. The animals have not been inoculated with any microorganisms nor been in contact with animals, which have been inoculated with any microorganisms.

### **Our sentinel program:**

Immunocompetent sentinels derived from breeding colonies of known microbiological status are obtained from commercial breeders (Charles River Laboratories, Harlan, Janvier etc.).

The microbiological status of laboratory animals is a direct result of the way an animal house is used. It is influenced to a high degree by the colony management practices, by the number of scientists, who have access to the facility, by the frequency of imports of animals into a facility, by the design of the facility etc.

The microbiological status of our animals is monitored by a sentinel program (soiled bedding sentinels, contact sentinels). It is performed on a regular basis to detect unwanted microorganisms as soon as possible. Since sentinels mirror the health status of mouse colonies on the day of investigation, they cannot be taken as guarantee of the present or future health-status.

### **A. Main serological investigation, every 22 weeks**

Our serological panel:

- Mouse hepatitis virus (MHV)
- Reovirus type 3 (Reo 3)
- Theiler's murine encephalomyelitis virus (TMEV)
- Pneumonia virus of mice (PVM)
- Sendai virus (SEN)
- Minute virus of mice (MVM)
- Mouse parvo virus (MPV)
- Ectromelia virus (Ectro)
- Lymphocytic choriomeningitis virus (LCMV)
- Mouse adenovirus (Mad K78)
- Polyoma virus of mice (Poly)
- Hantaan virus
- Mouse cytomegalovirus (MCMV)
- Rota virus (EDIM) epizootic diarrhoe of infant mice
- Mouse norovirus (MNV)
- Mycoplasma pulmonis/arthritis
- Clostridium piliforme Tyzzer's disease
- Pasteurella pneumotropica
- Toxoplasma gondii

Testing currently is carried out by:

**B. Whole animal investigation according FELASA 52m, every 22 weeks always 12 weeks after the last main serology**

This investigation comprises serology, parasitology, bacteriology and necropsy.

#### **SEROLOGY**

- Minute virus of mice (MVM)
- Mouse hepatitis virus (MHV)
- Pneumonia virus of mice (PVM)
- Reovirus type 3 (Reo 3)
- Theiler's murine encephalomyelitis virus (TMEV)
- Sendai virus
- Rota virus (EDIM)
- Mouse parvo virus (MPV)
- Murines Norovirus (MNV)
- Clostridium piliforme (Tyzzer)
- Mycoplasma pulmonis/arthritidis
- Virus der Lymphozytären Choriomeningitis (LCMV)
- Hantaan virus
- Ectromelia
- Zytomegalievirus der Maus (MCMV)
- Mouse adenovirus (Mad) 1
- Mouse adenovirus (Mad) 2
- Polyomavirus der Maus
- K Virus
- Mouse Thymic Virus (MTV)
- CAR bacillus (CARB)
- Encephalitazoon cuniculi (ECUN)
- Lactate Dehydrogenase Elevating Virus (LDEV)
- Prospect Hill Virus (PHV)

#### **PARASITOLOGY**

##### **Intestinal Protozoa**

- Giardia
- Spironucleus
- Trichomonas Sp
- Tetratrichomonas Sp
- Entamoeba muris
- Enteromonas Sp
- Chilomastix

##### **Helminths**

- Fecal Ova
- Syphacia obvelata
- Aspicularis tetraptera

##### **Arthropods (Ectoparasits)**

## BACTERIOLOGY

- *Bordetella bronchiseptica*
- *Citrobacter rodentium*
- *Corynebacterium kutscheri*
- *Helicobacter spp.*
- *Helicobacter bilis*
- *Helicobacter hepaticus*
- *Klebsiella spp.*
- *Pasteurellaceae*
- *Pasteurella pneumotropica (Heyl)*
- *Pasteurella pneumotropica (Jawetz)*
- *Pseudomonas aeruginosa*
- *Salmonella spp.*
- *Staphylococcus aureus*
- *Streptobacillus moniliformis*
- *B-hemolytic streptococcus*
- *Streptococcus pneumonia*
- *Yersinia spp.*

## NECROPSY

- External Lesions/Abnormalities
- Internal Lesions/Abnormalities

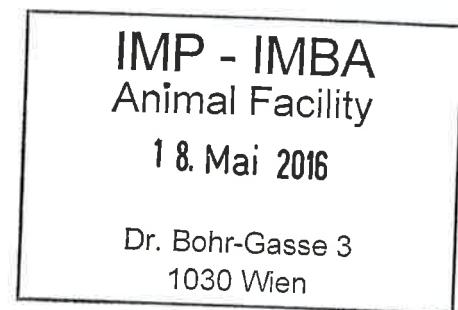

Testing currently is carried out by:
